

THREAT ADVISORY

WordPress fixes multiple security vulnerabilities

TA2022005

Threat Level

AMBER

Publish Date – Jan 10, 2022

WordPress development team has released the security update to patch the following four vulnerabilities out of which three of them have high severity.

1. CVE-2022-21661: A vulnerability exists in WP_Query class which is caused due to improper validation of a user-supplied string that is used to construct SQL queries.
2. CVE-2022-21662: A stored cross-site scripting vulnerability that allows an attacker with low privileges (such as authors) to execute JavaScript which might end up affecting users with high privileges.
3. CVE-2022-21663: A security vulnerability allows an attacker with Super Admin role to bypass explicit/additional hardening under certain conditions through object injection.
4. CVE-2022-21664: An SQL injection vulnerability caused due to lack of proper sanitization in one of the classes.

All these vulnerabilities have been fixed in version 5.8.3. Organizations can refer the patch links below to patch these vulnerabilities.

Vulnerability Details

CVE ID	Affected Products	Affected CPE	Vulnerability Name	CWE ID
CVE-2022-21661	WordPress Core versions 3.7 to 5.8.0	cpe:2.3:a:wordpress:wordpress:*:*:*:*:*	WordPress WP_Query SQL injection vulnerability	CWE-89
CVE-2022-21662	WordPress Core versions 3.7 to 5.8.0	cpe:2.3:a:wordpress:wordpress:*:*:*:*:*	WordPress cross-site scripting vulnerability	CWE-79
CVE-2022-21663	WordPress Core versions 3.7 to 5.8.0	cpe:2.3:a:wordpress:wordpress:*:*:*:*:*	WordPress security bypass vulnerability	CWE-74
CVE-2022-21664	WordPress Core versions 4.1.34 to 5.8.0	cpe:2.3:a:wordpress:wordpress:*:*:*:*:*	WordPress WP_Meta_Query SQL injection vulnerability	CWE-89
