THREAT ADVISORY

 **ATTACK REPORT**

Malevolent EvilExtractor Stealer Attacks Strike Europe and US

Date of Publication

April 26, 2023

Admiralty Code

A1

TA Number

TA2023199

Summary

Attack Began: March 30, 2023

Malware: EvilExtractor (also spelled Evil Extractor)

Affected Product: Microsoft Windows

Attack Region: Europe and US

Attack: A novel type of comprehensive malware called EvilExtractor has emerged in the cybercriminal marketplace. This malicious software is specifically designed to extract sensitive information and files from Windows operating systems. EvilExtractor has gained notoriety in Europe and the United States due to a recent increase in attacks.

Attack Details

#1

EvilExtractor is a novel type of malware that functions as an all-in-one stealer, allowing cybercriminals to extract sensitive information and files from Windows operating systems. The malicious software is equipped with multiple modules that operate via an FTP service, making it a powerful tool for targeted attacks on endpoint devices.

#2

Despite being marketed by its developer, Kodex, as a legitimate subscription-based service for \$59 per month, EvilExtractor has gained notoriety in the cybersecurity community for its use by threat actors, who have reportedly been promoting it on various hacking forums since 2022.

#3

On March 30, 2023 a phishing email campaign was discovered to be distributing the EvilExtractor malware. The malicious software disguises itself as legitimate files, such as Adobe PDF or Dropbox files, but upon execution, it deploys PowerShell-based malicious activities. In addition, it is equipped with environment checking and Anti-VM features.

#4

The primary objective of EvilExtractor is to extract browser data and other sensitive information from compromised endpoints and upload it to the attacker's FTP server. When the target attempts to open the file, a PyInstaller file is triggered, which launches a .NET loader that executes a base64-encoded PowerShell script, ultimately launching the EvilExtractor executable.

#5

It is important to note that EvilExtractor also possesses a ransomware function, which is incorporated into the .Net loader. The module, known as the "Kodex ransomware," can download a file from the evilextractor[.]com domain.

Recommendations

To safeguard against EvilExtractor attacks, businesses should stay alert and implement necessary measures. Regular phishing simulations, education, and awareness training are vital, but they may not fully consider MFA fatigue and web browser hygiene.

It is crucial to integrate and communicate all learned lessons. Also, verifying the authenticity of email attachments and untrusted links before opening them is crucial to prevent attacks.

Regularly back it up offline to protect critical data and install reliable anti-virus and internet security software on all connected devices. Enable automatic software updates whenever possible and practical. Additionally, consider implementing proactive security measures, such as blocking indicators of compromise (IoCs), to stay ahead of potential threats.
